AE 737: Mechanics of Damage Tolerance

Lecture 20 - Crack Retardation

Dr. Nicholas Smith

Wichita State University, Department of Aerospace Engineering

12 April 2022

1

schedule

- 12 Apr Crack Retardation, HW 6 Self-grade Due
- 14 Apr Finite Elements in Fracture
- 19 Apr Finite Elements in Fracture, HW 7 Due
- 21 Apr Exam Review
- 26 Apr Exam 2

outline

• crack growth retardation

2

crack growth retardation

crack growth retardation

- When an overload is applied, the plastic zone is larger
- This zone has residual compressive stresses, which slow crack growth until the crack grows beyond this over-sized plastic zone

4

crack growth retardation

- We will discuss three retardation models, but no model has been shown to be perfect in all cases
- The Wheeler method reduces da/dN, the Willenborg model reduces ΔK, and the Closure model increases R (increases σ_{min})

wheeler retardation

• As long as crack is within overload plastic zone, we scale da/dN by some ϕ

$$(a_i + r_{pi}) \leq (a_{aol} + r_{pol})$$

• And ϕ is given by

$$\phi_i = \left[\frac{r_{pi}}{a_{ol} + r_{pol} - a_i}\right]^m$$

• and the constant, *m* is to be determined experimentally

wheeler example

- (p. 340), A wide edge-cracked panel ($\beta=1.22$) has an initial crack length of 0.3 inches. Use $p=3.5~m_T=32$ and q=0.6 to grow a crack for two load cases.
- Use the Wheeler retardation model with m = 1.43, a plane stress plastic zone, and σ_{YS} = 68 ksi.
- Case 1: $\sigma_{max} = 18$ ksi and $\sigma_{min} = 3.6$ ksi for 12,000 cycles

6

wheeler example (cont)

• Case 2: $\sigma_{max}=18$ ksi and $\sigma_{min}=3.6$ ksi for 6,000 cycles, followed by one cycle of $\sigma_{max}=27$ ksi and $\sigma_{min}=5.4$ ksi, followed by another 6,000 cycles of $\sigma_{max}=18$ ksi and $\sigma_{min}=3.6$ ksi.

8

willenborg retardation

- Once again, we consider that retardation occurs when $(a_i + r_{pi} = a_{ol} + r_{pol})$
- Willenborg assumes that the residual compressive stress in the plastic zone creates an effective, $K_{max,eff}$ where $K_{max,eff} = K_{max} K_{comp}$
- The effective stress intensity factor is given by

$$K_{ extit{max,eff}} = K_{ extit{max,i}} - \left[K_{ extit{max,OL}} \sqrt{1 - rac{\Delta a_i}{r_{ extit{pol}}}} - K_{ extit{max,i}}
ight]$$

gallagher and hughes correction

- Galagher and Hughes observed that the Willenborg model stops cracks when they still propagate
- They proposed a correction to the model

$$K_{max,eff} = K_{max,i} - \phi_i \left[K_{max,OL} \sqrt{1 - rac{\Delta a_i}{r_{pol}}} - K_{max,i}
ight]$$

10

gallagher and hughes correction

• And the correction factor, ϕ_i is given by

$$\phi_i = \frac{1 - K_{TH}/K_{\max,i}}{s_{ol} - 1}$$

willenborg example

• Consider the Wheeler example problem with Willenborg parameters of $S_{ol}=2.3$ and $K_{th}=1$ ksi.

12

closure model

- Once again, we consider that retardation occurs when $(a_i + r_{pi}) = (a_{ol} + r_{pol})$
- Within the overloaded plastic zone, the opening stress required can be expressed as

$$\sigma_{OP} = \sigma_{max}(1 - (1 - C_{f0})(1 + 0.6R)(1 - R))$$

closure model

• Commonly this is expressed using the Closure Factor, C_f

$$C_f = \frac{\sigma_{OP}}{\sigma_{max}} = (1 - (1 - C_{f0})(1 + 0.6R)(1 - R))$$

• Where C_{f0} is the value of the Closure Factor at R=0

14

closure model

- When using the closure model, we replace R with C_f
- If the model we are using is in terms of ΔK we will also need to use $\Delta K = (1-C_f)K_{max}$

closure example

• Consider the Wheeler/Willenborg example problem with Closure parameters of $C_f0=0.3$ and $C_f=0.3728$

16

under-loads

- We might expect a compressive "underload" to accelerate crack growth
- This effect is not usually modeled for a few reasons
 - 1. Compressive underloads are uncommon in airframes
 - 2. The acceleration effect is minimal
 - Analysis is generally adjusted with experimental data, so acceleration can be built in to current model
 - Structures with large compressive loads are not generally subject to crack propagation problems
